

Three Digit max() Function

Create a C++ function (not program!) that will return the largest number of the three numbers that are sent to the function parameters.

The function declaration should look like this ...

```
int max(int num1, int num2, int num3)
{
    // Your code goes here
}
```

The function should be called from `main()` as follows ...

```
max(37, 11, 43);
```

Note: You can use any three numbers you want.
